ChiliProject - Bug # 839: ruby-debug19 breaks on Ruby 1.9.3

Status:	Closed	**Priority:**	Normal
Author:	Holger Just	**Category:**	Libraries
Created:	2012-01-18	**Assignee:**	Holger Just
Updated:	2012-02-06	**Due date:**	

Remote issue URL:	
Affected version:	
Description:	In the test group, we inclue @ruby-debug19@. This currently breaks on Ruby 1.9.3. I'd like to fix that for the final 3.0.0 release.
	Three possibilities:
	* We remove the @ruby-debug@ dependencies from the Gemfile completely and expect users who really need this to include it into their @Gemfile.local@
	* We try some workaround to make it work on 1.9.3
	* We don't care.
	Right now, I'm in favor of the first variant. Can I please hear a Yay or Nay for that in the next seven days?

Adds a setting for whether new projects should be public by default (closes #842, #839).

Patch by Rocco Stanzione, slightly edited.

[#839] Remove ruby-debug dependency.

It completely breaks on Ruby 1.9.3-p0. This is a stopper for people installing all groups. For the rest it is rarely used at all. Developers and testers requiring it can include it into their Gemfile.local

Please take ruby-debug19 out of the main Gemfile. It is only a development tool not a runtime dependency. Whatâ€™s more, currently the Gemfile.lock points to pre-release versions of linecache and ruby-debug-base19 that have to be manually tracked down and installed, even when on ruby 1.9.2

That's why it is the @test@ group which is not expected to be installed on production installs. See [[Bundler]] fr more information.

We don't ship a @Gemfile.lock@. That is generated by your local bundler. And on my systems, a new install on Ruby 1.9.2 with the test group included succeeds. It just breaks on 1.9.3 because of the incompatibility.

- Status changed from Open to Closed

I completely removed the dependency with commit:8e85cbd

2012-01-29 11:59 pm - Toshi MARUYAMA

- File ruby-debug19.diff added

- Status changed from Closed to Ready for review

This is a patch from my Redmine Rails3 branch.

Toshi, thanks for the patch. However, I came to the conclusion that requiring ruby-debeg in the core is more trouble than it's worth. Having to maintain a row of dependencies of pre-release gems doesn't feel very stable to me. And as I said in the commit message: it's rarely used by anyone and those people who know they need it can include it into their @Gemfile.local@.

Thus, I feel comfortable now to not include the dependency at all.

- Target version changed from 3.0.0 to 2.7.0

I backported the fix for 2.7. So the numerically first version this is patch is present is 2.7. This is slightly out-of-protocol but I really wanted to have the patch in 2.7.
